Outline

A short walk through the idea, the product and where it is going.

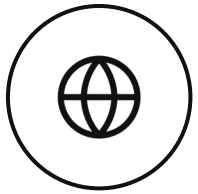

01	**The problem**	Why a first app is hard to build
02	**Our solution**	Write, preview and build
03	**The product**	Studio, editor and designer
04	**Proof it works**	Real apps, real APKs
05	**How it works**	Architecture in one picture
06	**Why it is different**	What sets AppPanrom apart
07	**Today and next**	Status, results and roadmap

Making your first app is harder than it should be.

Heavy tools

Android Studio, Gradle, Kotlin. Hours of setup before the first button appears.

A language barrier

Code is written in English keywords, a hurdle for many first-time learners.

Disconnected steps

Design, code and build live in different tools and never quite agree.

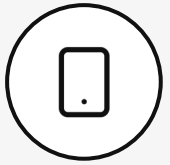

Write in Tanglish. Preview instantly. Ship an APK.

01

Write

A small language with Tanglish keywords: mari, enna_na, ovvoru, screen_uruvakku.

02

Preview

A live phone preview and a drag-and-drop designer that rewrites your code as you drag.

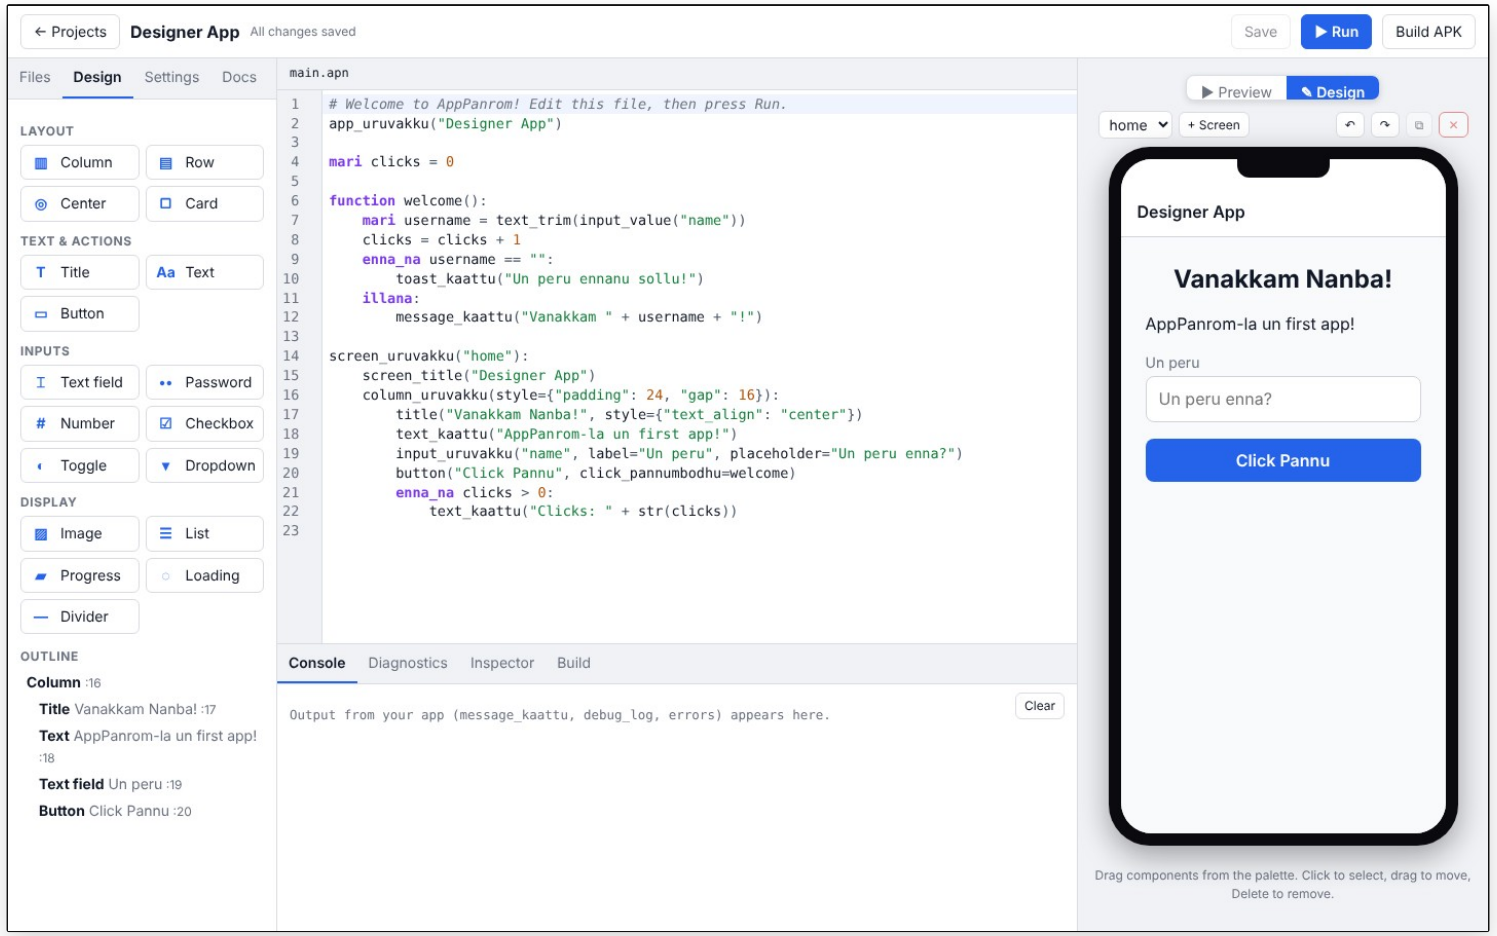

03

Build

One click generates an Android project, builds it and verifies the APK.

One window for the whole journey

Code editor

Syntax highlighting and friendly errors with suggestions.

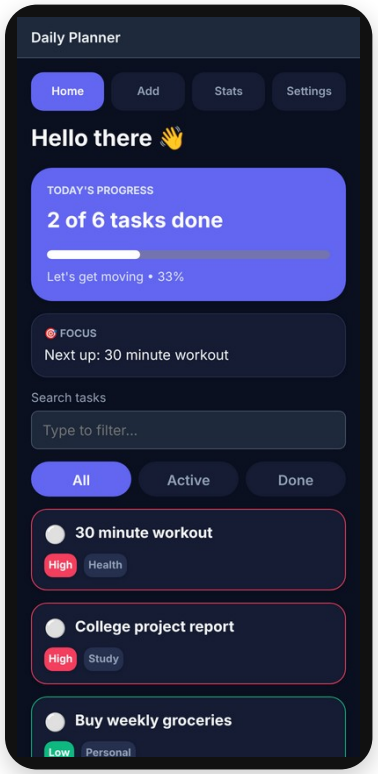

Visual designer

Drag components onto the phone. The code updates live.

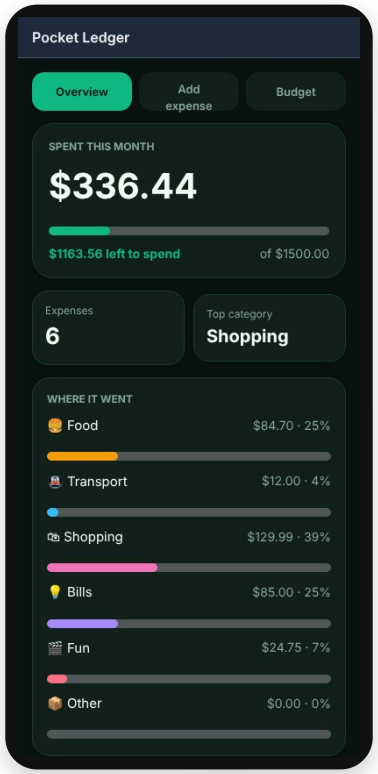

Local first

Your projects stay on your machine.

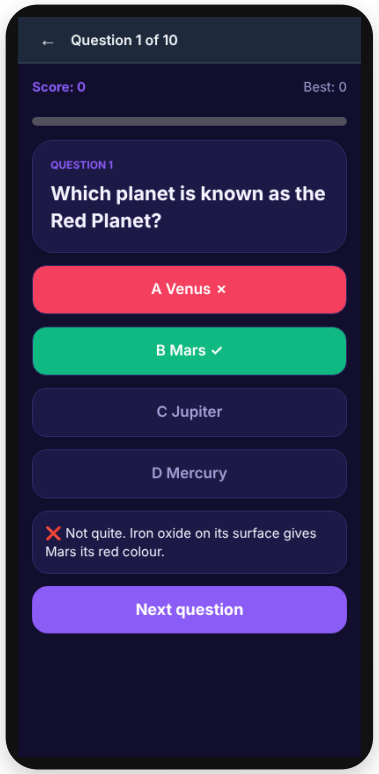

Real apps, built as real APKs

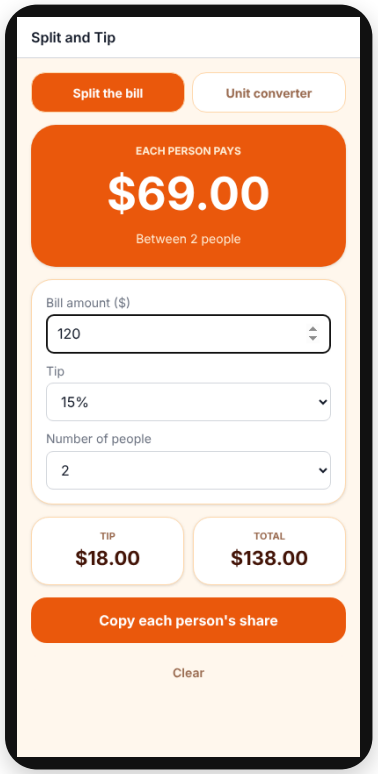

Daily Planner

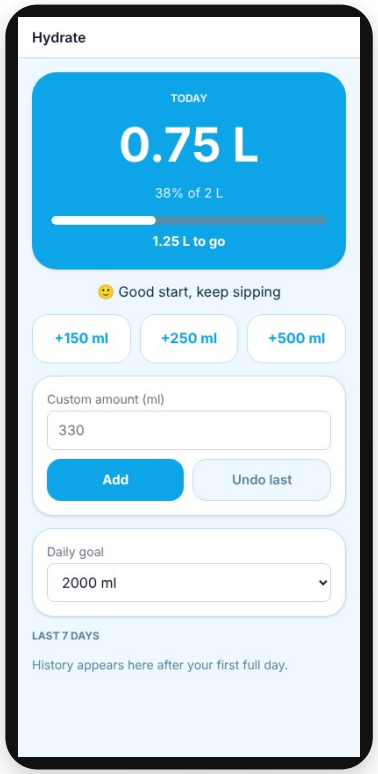

Pocket Ledger

Brain Quiz

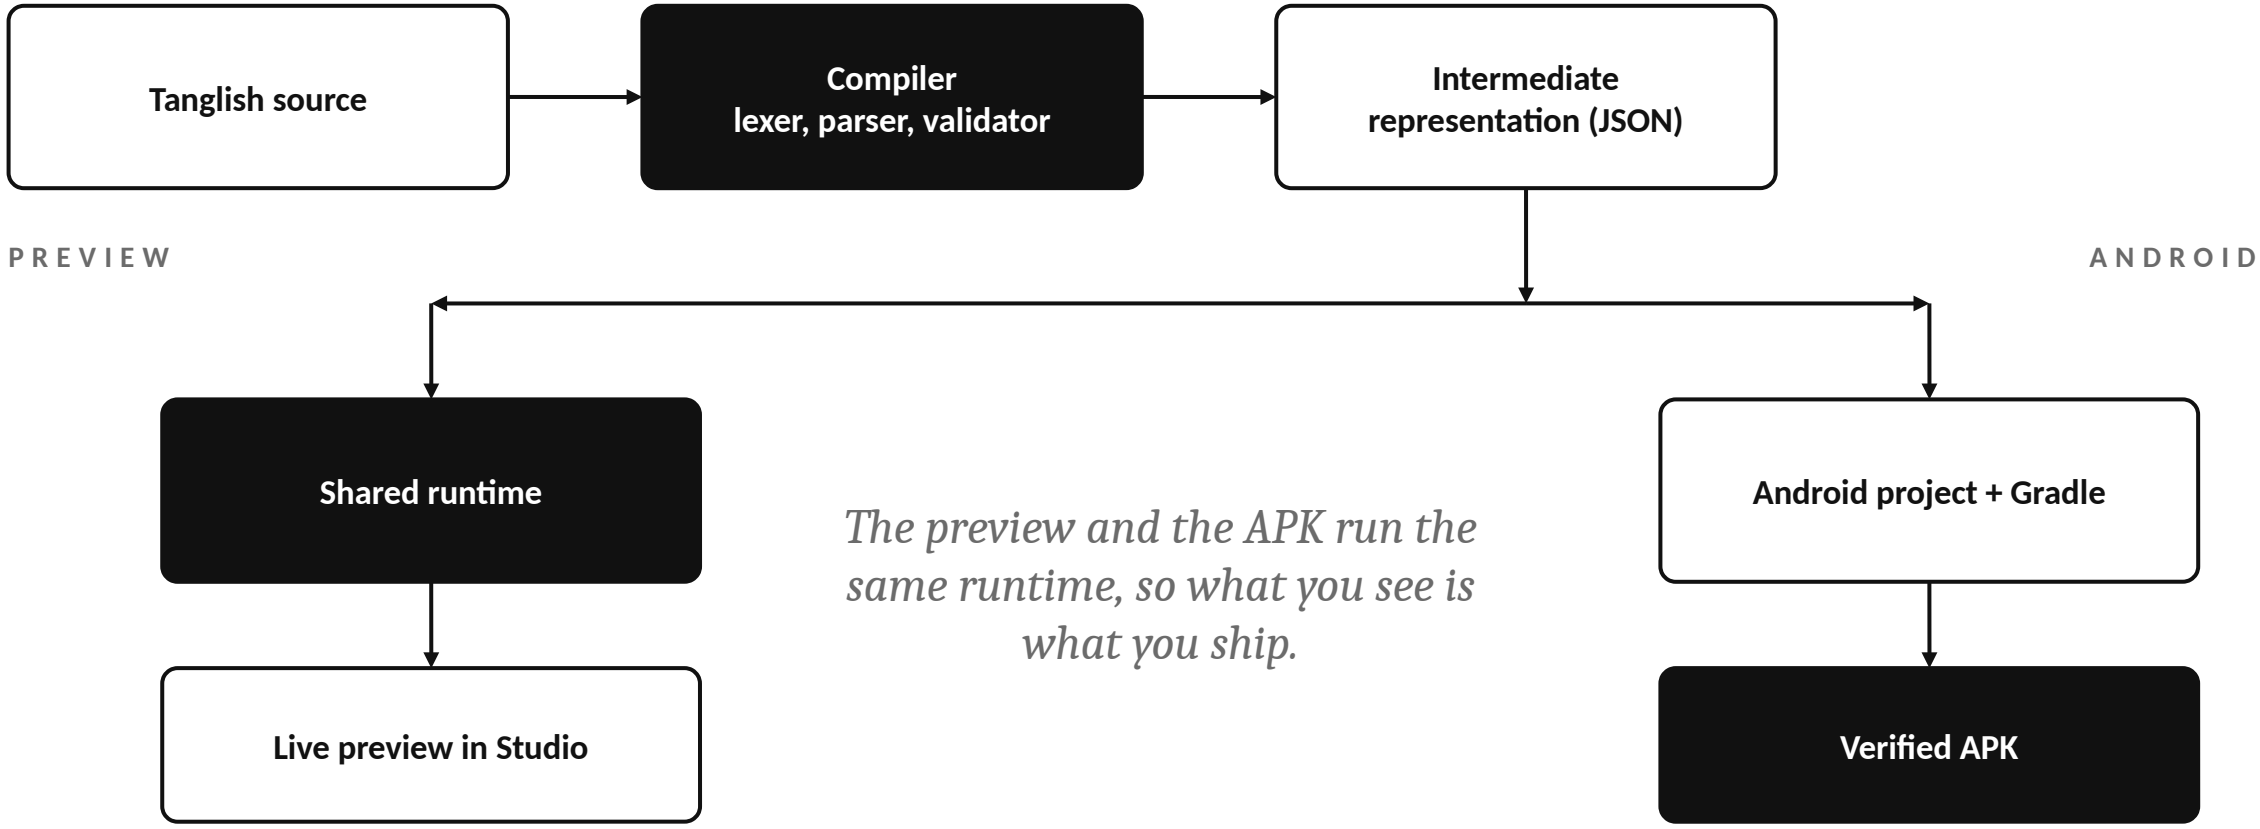

Split & Tip

Hydrate

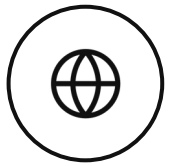

All written in AppPanrom. Seven apps built so far, including a calculator.

One compiler. One runtime. Two destinations.

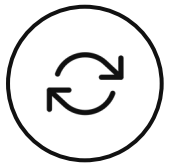

The preview and the APK run the same runtime, so what you see is what you ship.

Built for learners, engineered like a real tool.

Tanglish-first

Keywords learners already speak, with errors that suggest the fix.

Design and code stay in sync

The designer edits the source text itself, so nothing drifts apart.

Safe by design

User code is interpreted, never evaluated. No JavaScript bridge in the app.

Honest builds

A build is reported successful only when a verified APK exists.

Working end to end, with tests behind it.

156
automated tests

7
apps built as APKs

0
eval or exec of user code

1
runtime for preview and app

NOW

Language, Studio, designer and verified APK builds.

NEXT

Device testing, release signing and Play Store bundles.

LATER

Network access, camera and location, more regional languages.

Programming in your own language, on every phone. Thank you.
