# AppPanrom

Build Android apps in Tanglish

TEAM

P. Santhosh

M. Shalom Arputha Singh

Anand Institute of Higher Technology

THE PROBLEM

# Making your first app is harder than it should be.

## Heavy tools

Android Studio, Gradle, Kotlin. Hours of setup before the first button appears.

## A language barrier

Code is written in English keywords, a hurdle for many first-time learners.

## Disconnected steps

Design, code and build live in different tools and never quite agree.

OUR SOLUTION

# Write in Tanglish. Preview instantly. Ship an APK.

1

## Write

A small language with Tanglish keywords: mari, enna_na, ovvoru, screen_uruvakku.

2

## Preview

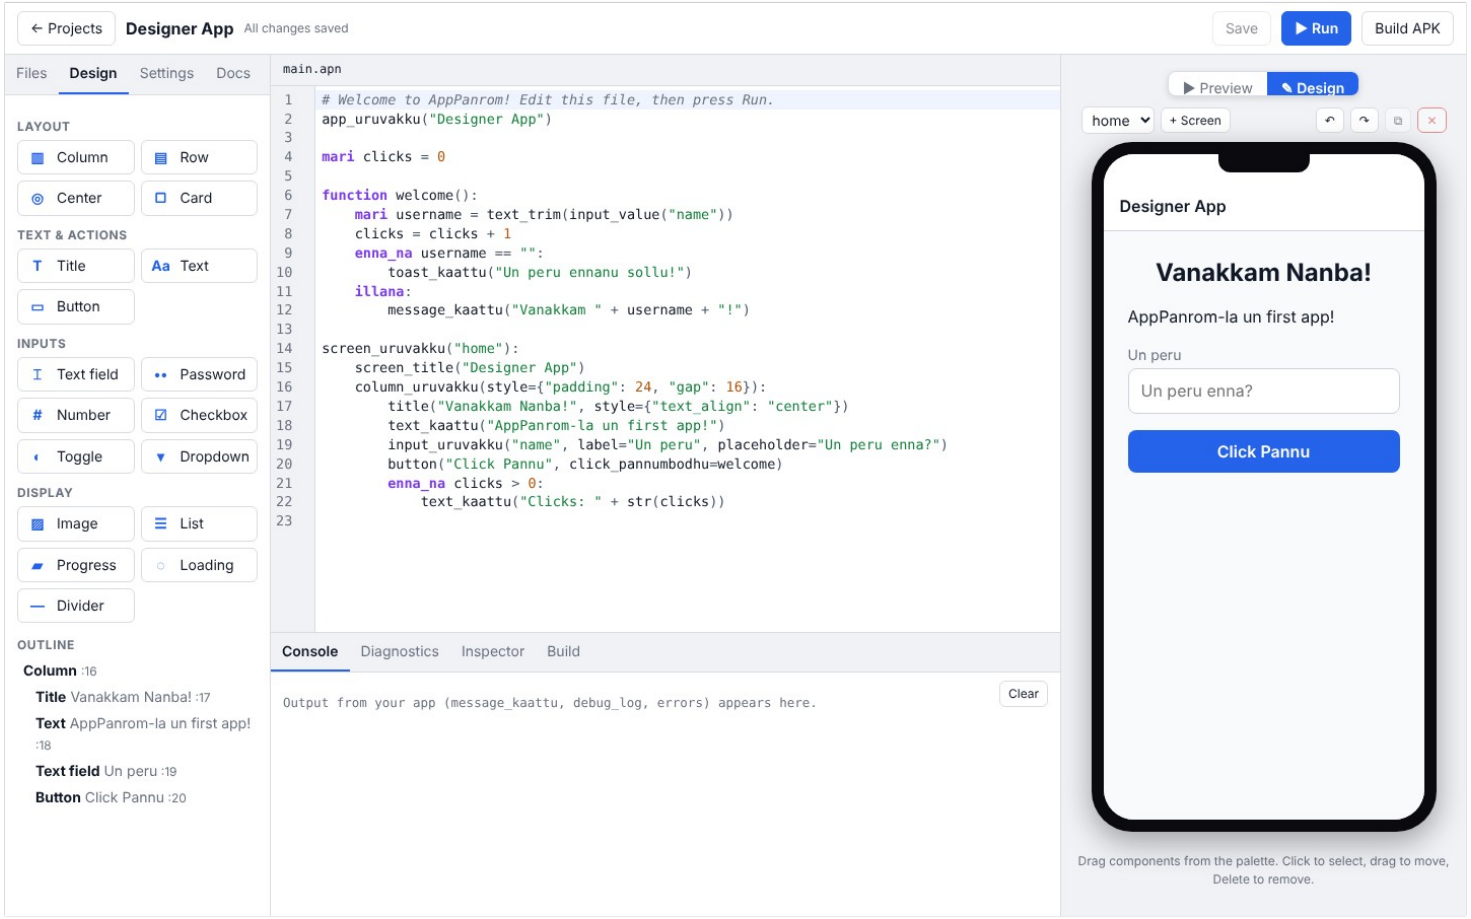

A live phone preview and a drag-and-drop designer that rewrites your code as you drag.

3

## Build

One click generates an Android project, builds it and verifies the APK.

# One window for the whole journey

## Code editor

Syntax highlighting and friendly errors with suggestions.

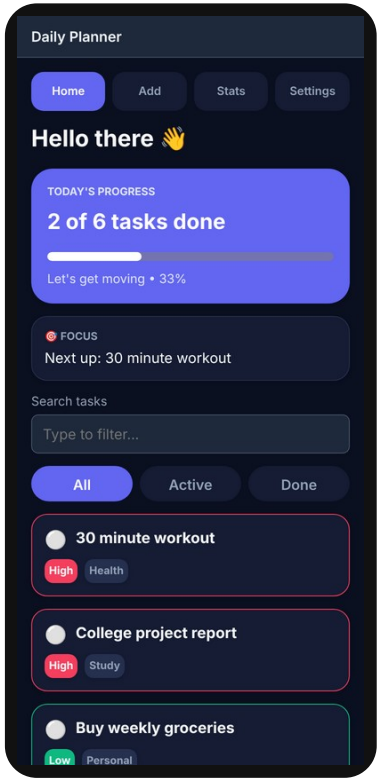

## Visual designer

Drag components onto the phone. The code updates live.

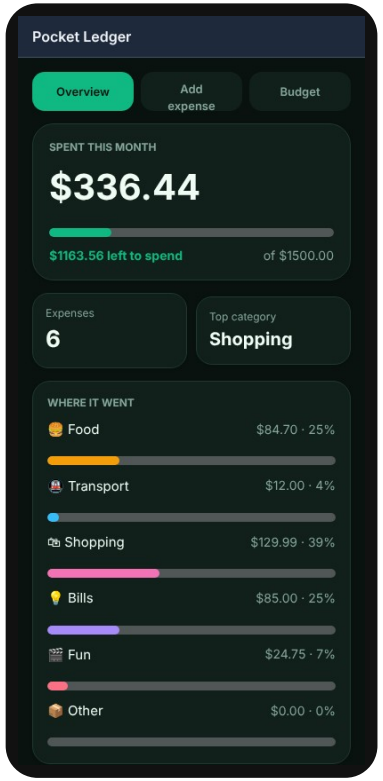

## Local first

Your projects stay on your machine.

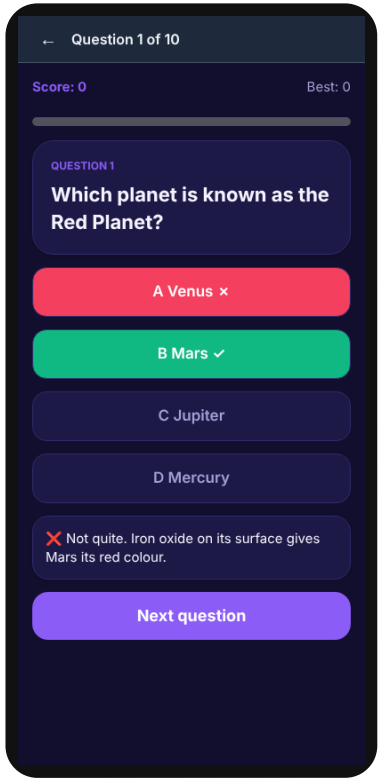

# Real apps, built as real APKs

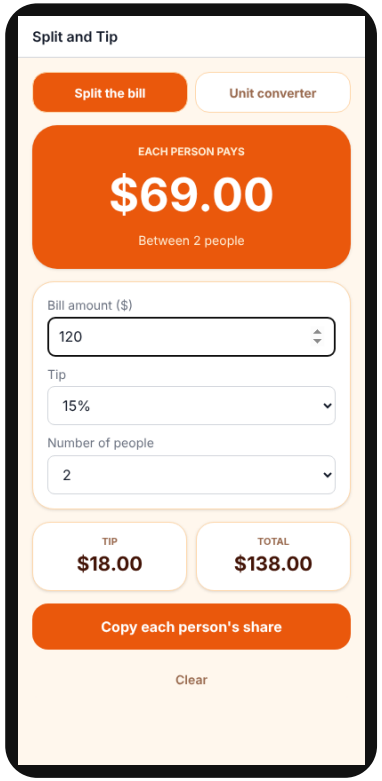

**Daily Planner**

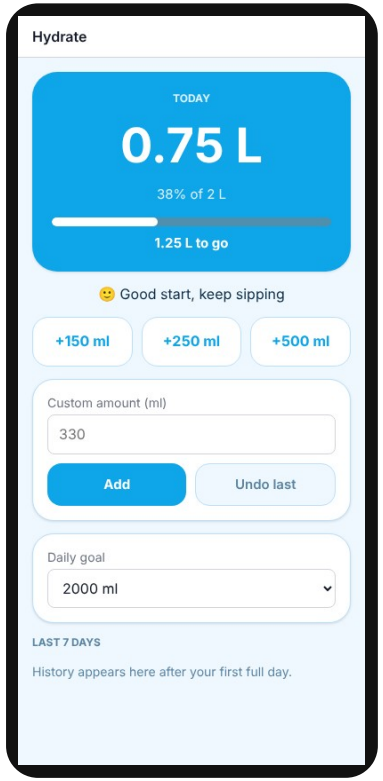

**Pocket Ledger**

**Brain Quiz**

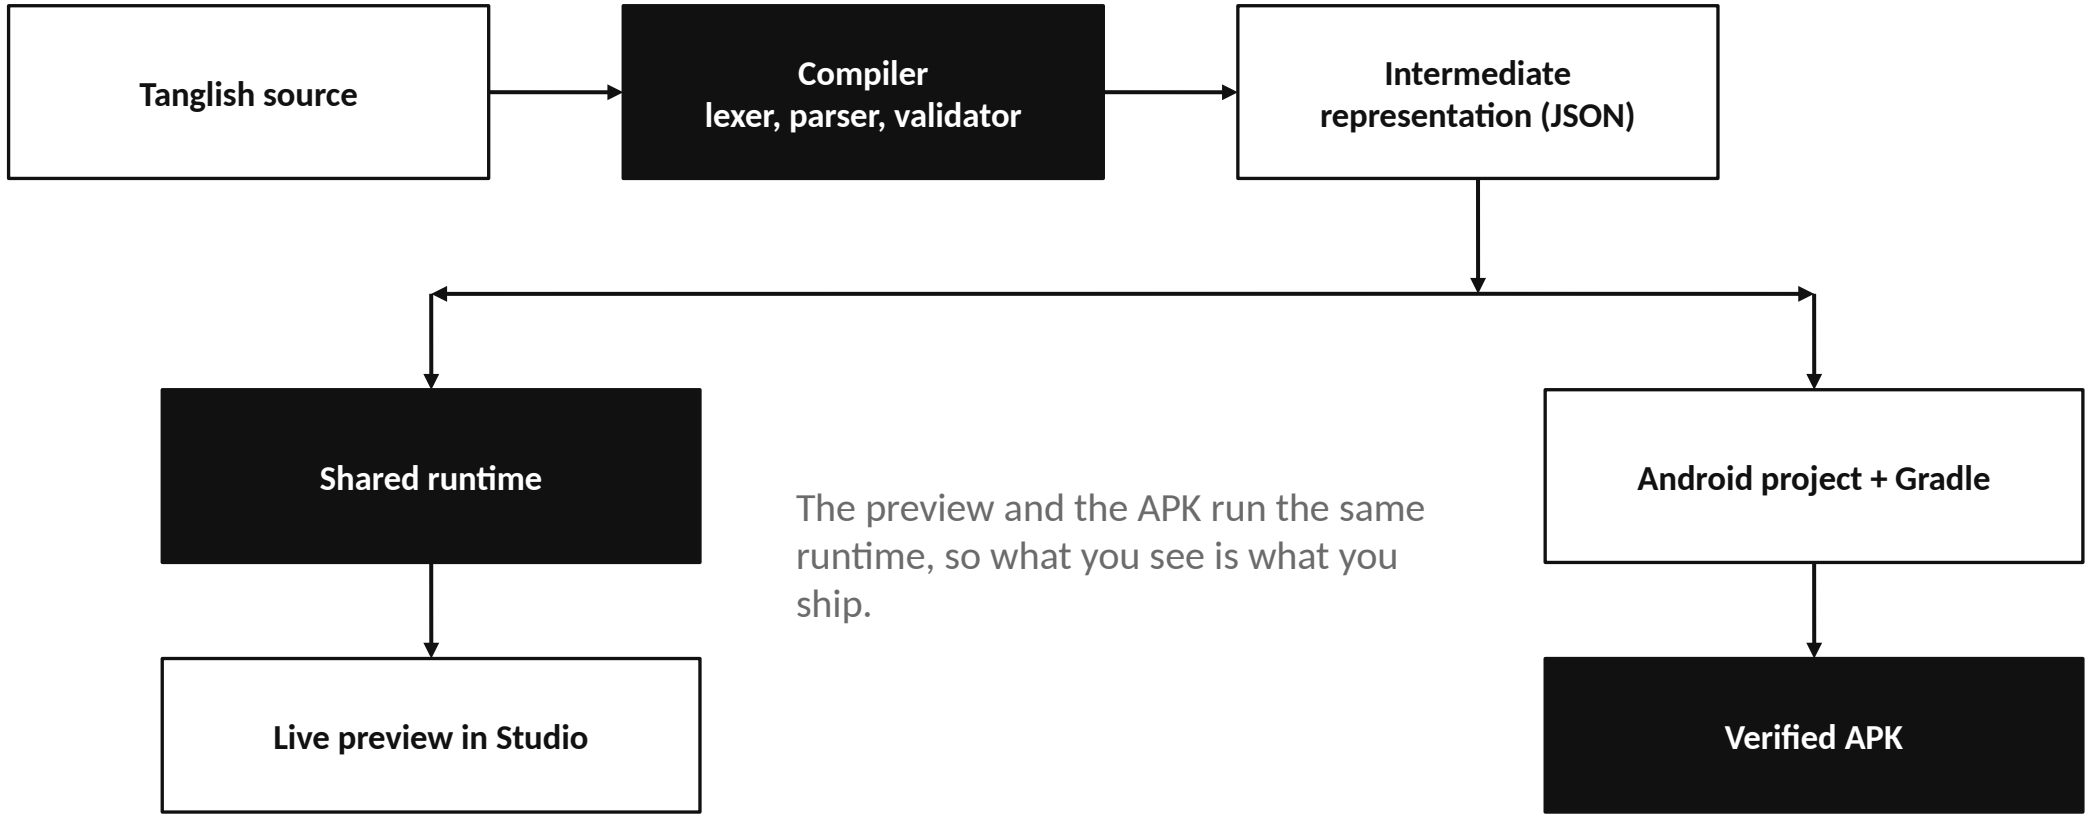

**Split & Tip**

**Hydrate**

All written in AppPanrom. Seven apps built so far, including a calculator.

# One compiler. One runtime. Two destinations.

The preview and the APK run the same runtime, so what you see is what you ship.

WHY IT IS DIFFERENT

# Built for learners, engineered like a real tool.

## Tanglish-first

Keywords learners already speak, with errors that suggest the fix.

## Design and code stay in sync

The designer edits the source text itself, so nothing drifts apart.

## Safe by design

User code is interpreted, never evaluated. No JavaScript bridge in the app.

## Honest builds

A build is reported successful only when a verified APK exists.

WHERE WE ARE TODAY

# Working end to end, with tests behind it.

**156**

automated tests

**7**

apps built as APKs

**0**

eval or exec of user code

**1**

runtime for preview and app

APKs are built by GitHub Actions with the real Android SDK and Gradle. Next we test them on physical devices.

WHAT IS NEXT

# Programming in your own language, on every phone.

## Now

Language, Studio, designer and verified APK builds.

## Next

Device testing, release signing and Play Store bundles.

## Later

Network access, camera and location, more regional languages.

## Thank you
